MEDICAL

SURGILIGHT OVERCOMES TRADITIONAL SURGICAL LIGHTING CHALLENGES.

SurgiLight provides versatile and safe illumination, which can be focused on specific surgical procedures.

The device supplements traditional overhead surgical lighting by allowing the LED light source to be precisely directed above the

patient via a long, flexible and maneuverable shaft. The result is the safe illumination of a surgical area from virtually any angle.

Satisfying both hospital safety regulations and the specific needs of the surgeon and his/her team, the SurgiLight measures 24" in length, has a max reach height (mounting height) of 80" and a comfortable working distance

(tip of SurgiLight to incision area) of 11-16". It easily accommodates the standard adjustable bed height of 32-38". The powerful light source incorporates an adjustable lens that can focus the beam spot size from 2"-5" depending on operating distance, making it a reliable, uniform light source for even lengthy procedures.
